

Why Oracle?

Every organization has a why—a purpose that drives its mission and inspires those within it. What draws me to Oracle, and specifically the Health Data Intelligence team, is your bold and ambitious why: to transform healthcare and improve lives through the power of data and technology.

Throughout my career, I've sought to align my skills as a data engineer with meaningful work. I believe that data, when properly harnessed, has the power to solve some of humanity's greatest challenges. In healthcare, the stakes couldn't be higher—data doesn't just tell stories; it saves lives.

About Me

In my current role, I've had the privilege of building data systems that do more than move numbers. They bring clarity to decision-makers and ensure better outcomes for individuals and communities. For example:

- Building Scalable Solutions: I've developed ETL/ELT frameworks using tools like AWS Glue and dbt, processing billions of records to support healthcare analytics at scale.
- Creating Impactful Insights: By working with complex datasets like claims and eligibility data, I've helped uncover actionable insights that drive operational efficiency and improve care delivery.
- Collaborating Across Teams: I thrive in cross-functional environments, ensuring technical solutions are not only robust but aligned with broader organizational goals.

Why Me?

At Oracle, the opportunity to combine technical innovation with a mission as impactful as advancing healthcare is one I find deeply motivating. Your emphasis on scalability, security, and delivering value to customers aligns perfectly with my experience and aspirations.

I believe that great teams thrive not only when they know what they do or how they do it but when they are deeply connected to why they do it. It's clear Oracle's Health Data Intelligence team understands this principle, and I would be honored to bring my skills and passion to help further that mission.

Thank you for considering my application. I would love the opportunity to discuss how my background and approach can contribute to Oracle's efforts to shape the future of healthcare.
